ALGAE-X[®] ANNOUNCES NEW Fuel Polishing & Recirculating System, the FPS-750

Ft. Myers Beach, FL - ALGAE-X[®] International is pleased to announce the release of its latest model Fuel Polishing & Recirculating System. The **FPS-750** is a higher capacity version of the FPS-500. It features a 120/220V AC 50/60Hz pump capable of pumping 3.5 GPM or 210 gallons of fuel per hour.

The **FPS-750** is a self-contained system that allows fuel to be periodically re-circulated to easily remove water, sludge (organic material referred to as “algae”) & inorganic debris from the fuel, and eliminate microbial contamination.

Principal components include: **ALGAE-X[®]** model 1500 Fuel Conditioning Unit, Separ Fuel/Water Separator & Filter, six (6) hour manual timer, fuel pressure gauge and a continuous duty gear pump.

The **FPS-750** improves and maintains the quality of diesel fuel, hydraulic oil and other distillate fuels. It prevents tank sludge, clogged filters and keeps your fuel in a pristine condition. **ALGAE-X[®]** technology improves filtration, combustion and fuel stability. This results in:

- More efficient engine operation, extended injector life, reduced fuel consumption, lower emissions and elimination of carbon deposits.
- More reliable engine filtration systems with longer fuel filter change intervals and less tank maintenance.

Algae-X provides a significant improvement in fuel economy, with a dramatic reduction of soot, smoke and emissions, while lowering overall operating costs.
